

The Climate Risk in the Seacoast: Assessing Vulnerability of Municipal Assets and Resources to Climate Change (C-RiSe) project provides maps and assessments of flood impacts to infrastructure and natural resources in the coastal Great Bay region associated with projected increases in storm surge, sea level, and precipitation.

Grid Key:

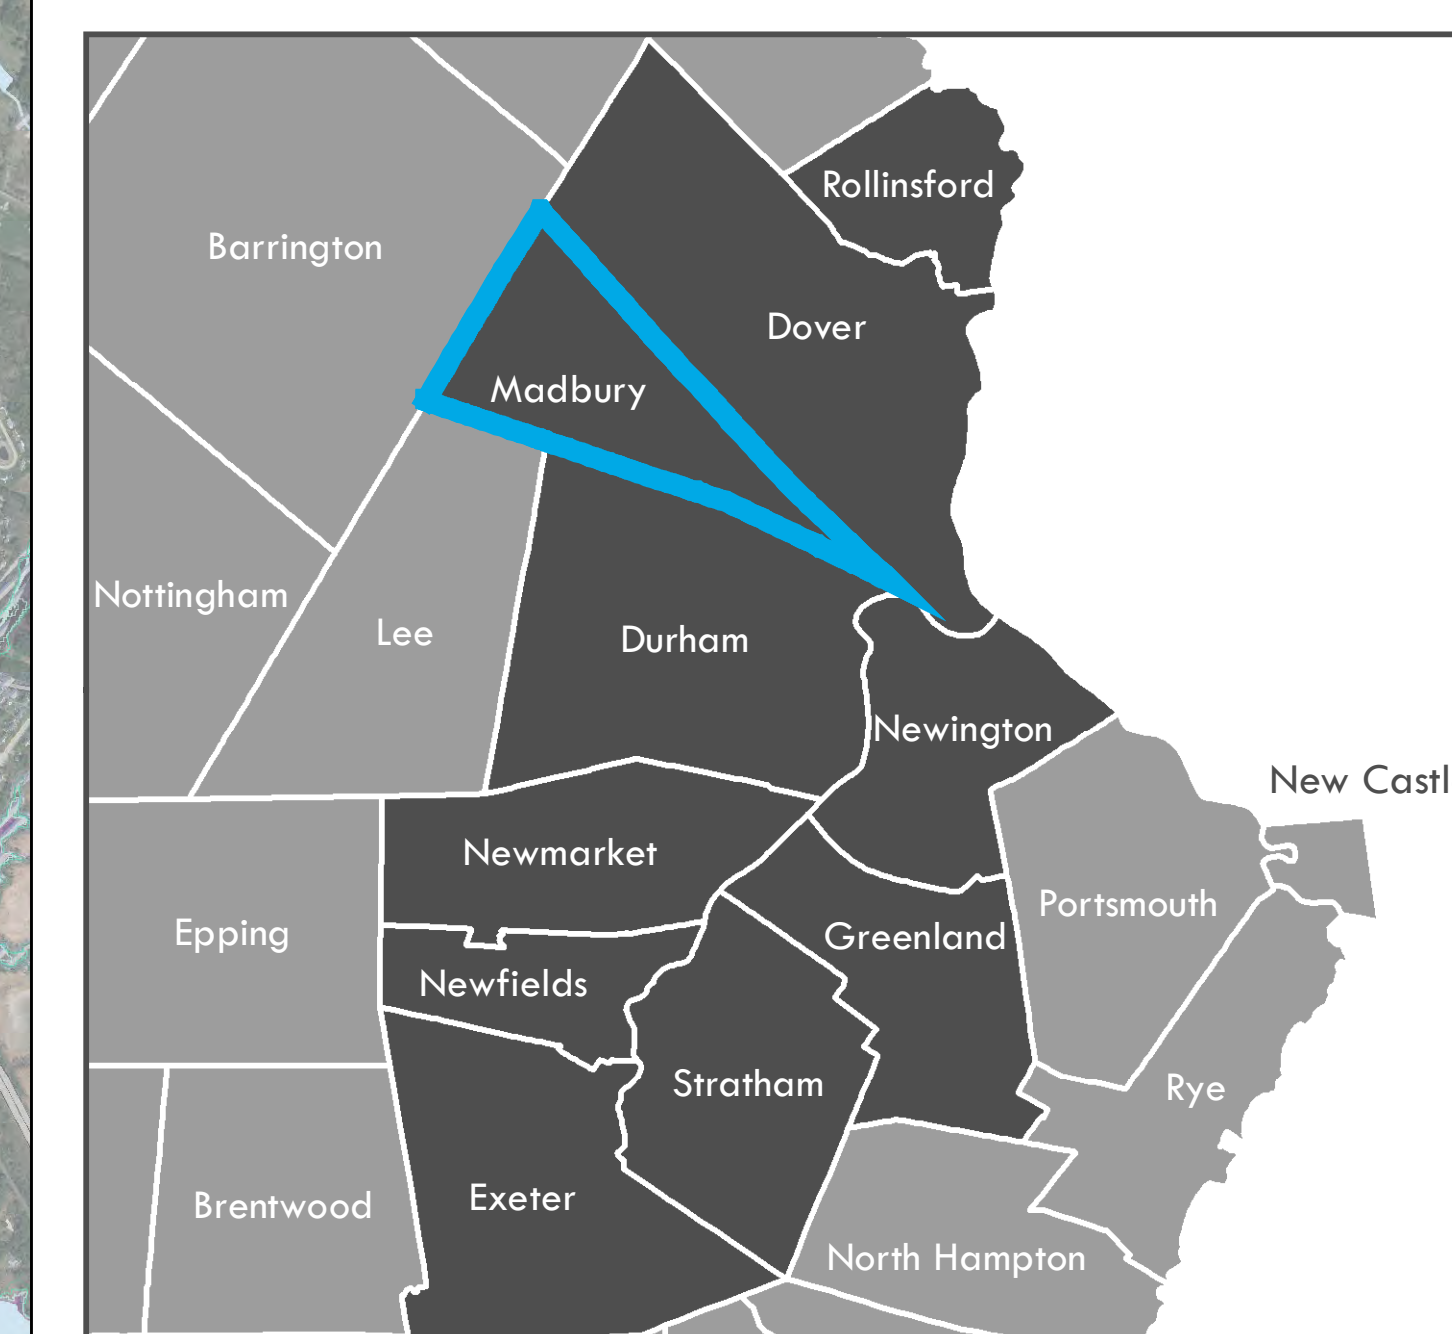

10 -YR Rating	25-YR Rating	50-YR Rating	100-YR Rating
10-YR: Rating for the water's surface elevation at the inlet for the 10-yr flood flow	25-YR: Rating for the water's surface elevation at the inlet for the 25-yr flood flow	50-YR: Rating for the water's surface elevation at the inlet for the 50-yr flood flow	100-YR: Rating for the water's surface elevation at the inlet for the 100-yr flood flow

Hydraulic Ranking Key:

- Pass: Headwater stage is below the lowest top of top of culvert at the site
- Transitional: Headwater stage is between the lowest top of culvert and the top of the road
- Fail: Headwater stage overtops the road

Aquatic Organism Passage (AOP) Key

- No AOP
- No AOP - Adult Salmonids
- Reduced AOP
- Full AOP

Sea-Level Rise Scenarios
Please note that the sea-level rise scenarios used in this assessment were derived from the Wake, 2011 report (refer to table of values below from this report). These scenarios were selected prior to the release of the Science and Technical Advisory Panel Report to the N.H. Coastal Risks & Hazards Commission, in August, 2014 [1]. While slightly different than the scenarios cited in that report, they yield coverage estimates that are within the mapping margin of error.
